

PC Security Review & Audit

As a result of this pc security review and audit the customer will be assured of having a personal computer that is free from spy-ware, ad-ware, advertising popups, viruses, Trojans, keystroke retainers, and other malicious software code artifacts. In addition, recommendations for maintenance of a secure personal computer will be made. Along with comments on web browsing, personal identity theft, and software purchase considerations, checklists and a work program will be provided as training for the PC owner. The PC owner will perform the security audit with the in-home, on-site security counselor. Remote PC security review and auditing is also available.

Security is an on-going process from a benchmark. Lock the door with a PC security review and audit.

PC Security Review & Audit

Do you rely on your PC to perform financial transactions?

Has your teenager reconfigured your PC?

Is your PC transmitting more information than it is receiving?

Are advertisements appearing at strangely appropriate times?

This PC security review and audit performs a vulnerability assessment and subsequently provides a protection strategy. From the benchmark of a secure system, the PC owner can move forward with the knowledge that their system is secure. This ensures if/when their PC is breached the minimal in recovery is required. Their PC operations is minimally interrupted or delayed. Their downtime spent on fixing their PC is lessened. And finally their information and/or identity minimally corrupted or lost.

Vulnerability Assessment

During the vulnerability assessment, security weaknesses will be identified. In particular, security risks from the Internet, remote access services, WI-FIs and virtual private networking will be considered. Penetration testing, database security considerations, and LAN (local area network) security issues are separate chargeable activities. Activities in the vulnerability assessment include:

- checking of anti-virus protection;
- windows update verification;
- verification of emergency repair disk;
- monitoring of selected event logs;
- scanning for ad-ware, spy-ware, and malicious code. And,
- removal of malicious code including registry entries.

Protection Strategy

Having provided the customer with a secure personal computer, a protection strategy will be provided. This strategy could be as simple as scheduling of regular software updates, virus scans, and security testing. However, depending on the customer hardware/software/connection configuration additional comments may be made concerning:

- IP addresses,
- firewall strategies,
- database encryption,
- password storage, and
- countermeasures.

In addition, comments on secure web surfing, e-mail approaches, phishing identification and spam control will be made.

Maintenance / Business

Contract Available

The attacks on PC owners are changing from kiddy hacker vandals who want bragging rights to organ-

ized crime. This cyber crime change will eventually be controlled through many different methods. However, while the Internet is being reconfigured, while standards for e-mail identification are being discussed, while hardware/software vendors add security to their products, and while laws such as CAN-SPAM are being passed, the prudent PC owner may want routine PC security reviews and audits. Optional remote services, multiple computer discounts, and scheduled reviews are available. Please inquire with your specific needs.

Pricing Summary

Vulnerability assessment (verify windows update, verify emergency repair disk, verify PC configuration, check anti-virus software, scan for malicious software artifacts, check selected event logs)

Protection Strategy (remove malicious software, provide check lists, discuss approaches)

Edmonton Area in-home PC security review and audit (about 2 hours) **\$199.95 +GST**
